

ARCH SETUP

This is my personal repo containing my setup scripts
for arch linux

But feel free to use them

TESTING MATH

$$c \neq \frac{a + b}{a}$$

SHELL AND PROMPT

To install my zsh shell and starship prompt run the command below. This command uses pacman to fetch the required packages from Arch repos. To instal it on other linux distributions or any unix based systems run the command and do as it says. Note that it requires bash.

TO INSTALL ZSH AND STARSHIP:

```
--proto '=https' --tlsv1.2 -sSf https://raw.githubusercontent.com.
```

ARCH PROOT ON TERMUX

To install arch linux on termux and to run it every time when you open it, run the following command in termux shell after installing proot-distro (``pkg install proot-distro``) and archlinux (``proot-distro install archlinux``)

This script overwrites the .bashrc file in termux home and archlinux's root home. If you exit from the shell with 0 return code (e.g. ``exit 0`` or ``exit``) the termux shell will also exit but if you exit with any non zero value the termux prompt will not close.

SETUP ARCH LINUX ON TERMUX:
